FUMIGATION AND PEST CONTROL

Our collection of fumigation process

ABOUT US

Misarma Enterprise Sdn. Bhd. (MSM) is a wholly owned and a well-established company since the year 2009. We engage in timber, construction, Marine, and oil and gas related industry. In this ever-evolving industry, Misarma has realized the importance of innovation and improvement. To cope with rapid development and services, Misarma has successfully ventured the business into pest control and fumigation services from timber, building to vessel to satisfy our customers' need.

Misarma specialize in providing full spectrums pest management solutions to a gamut of industries and business. Adhering to global standard and recognized by Jabatan Pertanian Malaysia, we help you get rid of pest menace. With decades of experience, our experts are dept at providing highly cost effective, eco-friendly and noninstructive solutions. Furthermore, our pest control team is consistently updated with the latest skill and knowledge to ensure effectiveness is guaranteed.

PEST MANAGEMENT

A non-effective fumigation may leave an adverse impact towards the Malaysian export trade by raising doubts about the integrity of Malaysian export agricultural produce. Misarma ensure your goods up to Government export/import with no doubt Custom Clearance.

We are also an MAFAS (Malaysia Fumigation Accreditation Scheme), AFAS (Australia Fumigation Accreditation Scheme), ISPM-15 (International Standards for Phytosanitary Measures No.15) accredited fumigation company. Subsequently, we do also provide fumigation and pest control services for warehouses, vessel and storage units, such as grains and furniture storage.

FUMIGATION

Fumigation is a targeted treatment technique that is commonly used by professionals in pest management to effectively control pest that attack stored goods and commodities.

COMMERCIAL PEST CONTROL

Pest control is the process of managing or removing pest from the house or place of business. The goal is to prevent or minimize structural or other damage caused by these pest and reduce the risk of pest spreading a disease or illness to people.

QUARANTINED FUMIGATION

Fumigation is recognized as an effective means of targeted control of Stored Product Insects (SPIs) such as beetles, weevils, mites and moths. It can safeguard businesses such as shipping and cargo, warehousing and agriculture. This ensures that shipments are transported safely and without risk of contamination.

QUARANTINE FUMIGATION

Cover fumigation service is where the product or item will be covered with a gas proof fumigation tarp and sand snaked around all of the edges to achieve and maintain a gas seal. (OR covered with an airtight tarpaulin sheet to ensure optimum concentration of methyl bromide gas so that it becomes completely pest-free). The items are treated with fumigant under gas proof sheeting for a minimum period before being ventilated.

Our experts can perform the necessary timber fumigation treatments and pre-shipment certificates of the relevant quarantine treatment. We perform fumigation of wood and timber products under supervision of the appropriate phytosanitary authorities. When fumigating products, we ensure the suitable protocol is used regarding concentration and selection of fumigant such as methyl bromide gas or phosphine.

ISPM-15 CERTIFICATION

Wood packaging material bearing the stamp mark is certified as being ISPM 15 compliance. To ensure the compliance with wood packaging material regulations, Misarma performs the service in accordance with regulation 15 of the International Standards for Phytosanitary Measures (ISPM15). Developed by the International Plant Protection Convention (IPPC) that directly addresses the need to treat wood materials of a thickness greater than 6mm, used to ship products between countries, ISPM15 helps to prevent the international transportation of diseases and insects that could negatively affect plants or ecosystems.

QUARANTINED FUMIGATION

CONTAINER FUMIGATION

Container fumigation controls any type of pest through an efficient, safe and dry disinfection process, which is usually done by gas. The most commonly used gases in the fumigation process are methyl bromide and phosphine. Although both maintain the same level of effectiveness; methyl bromide is more frequently used in containers. In order to receive the fumigant, the container must have its structures in good condition. The fumigation site must be isolated within a radius of 5 meters, and a sticker containing basic information such as date and time of start and end of treatment should be attached to the container's door.

VESSEL FUMIGATION

Pest infestation is not uncommon onboard vessels and ships. It is essential to take charge of the situation to eliminate pests especially rats, as part of legal requirements. Prior conducting vessel fumigation, it is necessary to vacate risk areas and ensure that effort has been made to seal all openings to prevent the fumigant (Methyl Bromide) used from escaping. Re-entry into the fumigation area is only allowed when it has been declared safe and free of gas by the fumigators-in-charge. This is after tests are carried out to confirm the gas concentration level is below OES (Occupational Exposure Standard).

NON QUARANTINED FUMIGATION

Non-quarantine fumigation is conducted in enclosed spaces such as warehouse with goods and commodities being stored. Fumigation is carried out to protect your production goods against the ravages of pests. The space for fumigation relates to warehouses, shop lots or even ships and vessels. Instead of tarp wrapping of goods or commodities, nonquarantine (space) fumigation is done first by ensuring that every possible gap holes of a space are being sealed or filled. The process includes the filling of gaps, releasing of gas in the space and out of the space after a certain period of time.

COMMODITY FUMIGATION

Commodity fumigation is the treatment of a product by gas, chemical or other process to eliminate the risk of a pest infestation. A commodity can be described as anything from grain to personal effects imported or exported from one country to state to another.

Stored products pests are very sturdy and can adapt to almost any condition and location. The infestation can occur at any stage from packaging to transport to storage and shelving. Food pests can be found in all forms: egg, larvae, or pupal and adult form.

Stored product pests not only deteriorate the quality of food but more importantly in the case of heavy infestation can cause skin irritations and both animals and human may suffer intestinal disorders from eating infested foods.

NON QUARANTINED FUMIGATION

GENERAL PEST CONTROL

Having a clean environment for the work space is a must for all corporate premises to ensure a conducive working environment. Most insects do not harm human products nor carry diseases harmful to human. However, some do carry diseases, feed on human food, clothing, housing and manufactured goods.

Misarma apply the latest & most effective techniques including spraying of approved chemicals, traps/trays, application of gel baits and other form of baiting systems. We choose the products poses minimal risk and special care and attention are taken to minimize any possible adverse impact to the environment.

Our service area includes corporate, commercial and residential clients. We offer general pest control services for the control and elimination of pest such as : rodents, cockroaches, common ants, termites, houseflies, mosquitoes, storage insect pest, bed bug, flea, spider, fly insects and other pests.

DISINFECTION SERVICES

Disinfection is important for keeping properties and the people in them healthy and safety. There are many types of sanitation tools and equipment in the market. Our surface sanitisation solution aims to provide customers a peace of mind. In addition, assurance in terms of safety, efficacy and credibility are our key priorities too.

Checklist for pre- and post-treatment needs In general, we recommend to perform the following before treatment:

1. Clean up the space and ensure clutter is minimal.
2. Store food items or food consumption tools away.
3. Cover well fish tank if there is any.
4. Relocate pets and employees or end users.
5. Protect any essential items that may be valuable or sensitive.

Similarly, after treatment, we encourage customers to comply following:

1. Evacuate and return a range from 2 to 4 hours later.
2. Ventilate the space well.
3. You may clean the place.
3. Lastly, resume activities per normal thereafter.
